

Airtable Research

Overview

Airtable is a hybrid project management and database platform that combines the simplicity of spreadsheets with the power of databases. It allows users to organize work flexibly using tables, views, and customizable workflows.

Key Features

- Table-based task and project management
- Multiple view options (Grid, Kanban, Calendar, Gantt, Gallery)
- Relational linking between tasks, users, and projects
- Built-in forms for data collection
- Automations for repetitive tasks (notifications, updates)

Examples

- Marketing campaign planning using tables and Kanban views
- Content production pipelines with Calendar and Gantt tracking

Pros

- Extremely flexible for different types of projects
- Intuitive drag-and-drop and filtering options
- Powerful automation without needing coding skills
- Easy to set up basic project databases quickly

Cons

- Advanced workflows require premium plans
- Can become confusing without good structure
- Not as specialized for agile software development as Jira or Trello

Lessons for SonicPoints

- Add customizable task views — allow users to switch between List, Kanban, Calendar (future enhancement)
- Allow relational linking between tasks (e.g., task dependencies like "Task A must finish before Task B starts")
- Introduce simple automations for Admins — like auto-reminding users when a due date is near
- Keep basic functionality easy but offer "power features" optionally for advanced users
